Perfect — this is the exact clarification we needed.

You're not building *yet another* horizontal agent platform. You're building the **foundation for a vertical Revenue Operations OS** — one that ships day-one with RAG over company comp plans, policies, CRM data, and historical payouts, plus purpose-built SPM + CRM agents. Users (RevOps leaders, sales ops, finance) get to create their own agents **exactly the way they think** (natural language + visual refinement), then organize them into real business units (EMEA, Product Line X, Enterprise Sales, etc.).

This leans hard into your domain moat (Performio/CaptivateIQ/Iconixx scars) and dodges the crowded horizontal lane. Smart.

Bold UI Vision: “Lanara” — The Revenue Agent Platform

We go full **2026 enterprise-bold**: think **Linear + Figma + Arc + liquid glass** (the evolved glassmorphism everyone is using this year). Dark mode first, translucent “liquid glass” cards with subtle refraction and depth, spatial canvas, buttery micro-animations, and data-dense yet calm. No more sterile enterprise gray — this feels premium, alive, and *powerful*.

Core philosophy:

- **Spatial-first**: Everything lives on an infinite, zoomable canvas (like Figma meets LangGraph Studio on steroids).
- **Business Units are first-class citizens**: They’re not just folders — they’re visual zones/containers that inherit permissions, scoped RAG documents, and agent context.
- **Hybrid creation**: Type or speak → AI scaffolds the agent instantly → you refine visually.
- **Enterprise polish with soul**: Role-based views, audit trails visible in the UI, live agent health, one-click “publish to unit.”

Here’s how the main experiences feel:

1. Business Units Hub (Home screen)

Top-level navigation that mirrors your org structure.
Left sidebar: collapsible hierarchy (Global → EMEA → Germany → Enterprise Sales).
Main area: live dashboard cards for each unit showing active agents, current attainment, RAG health, and agent activity feed.
One-click “Create Agent” floating action button with natural language prompt.

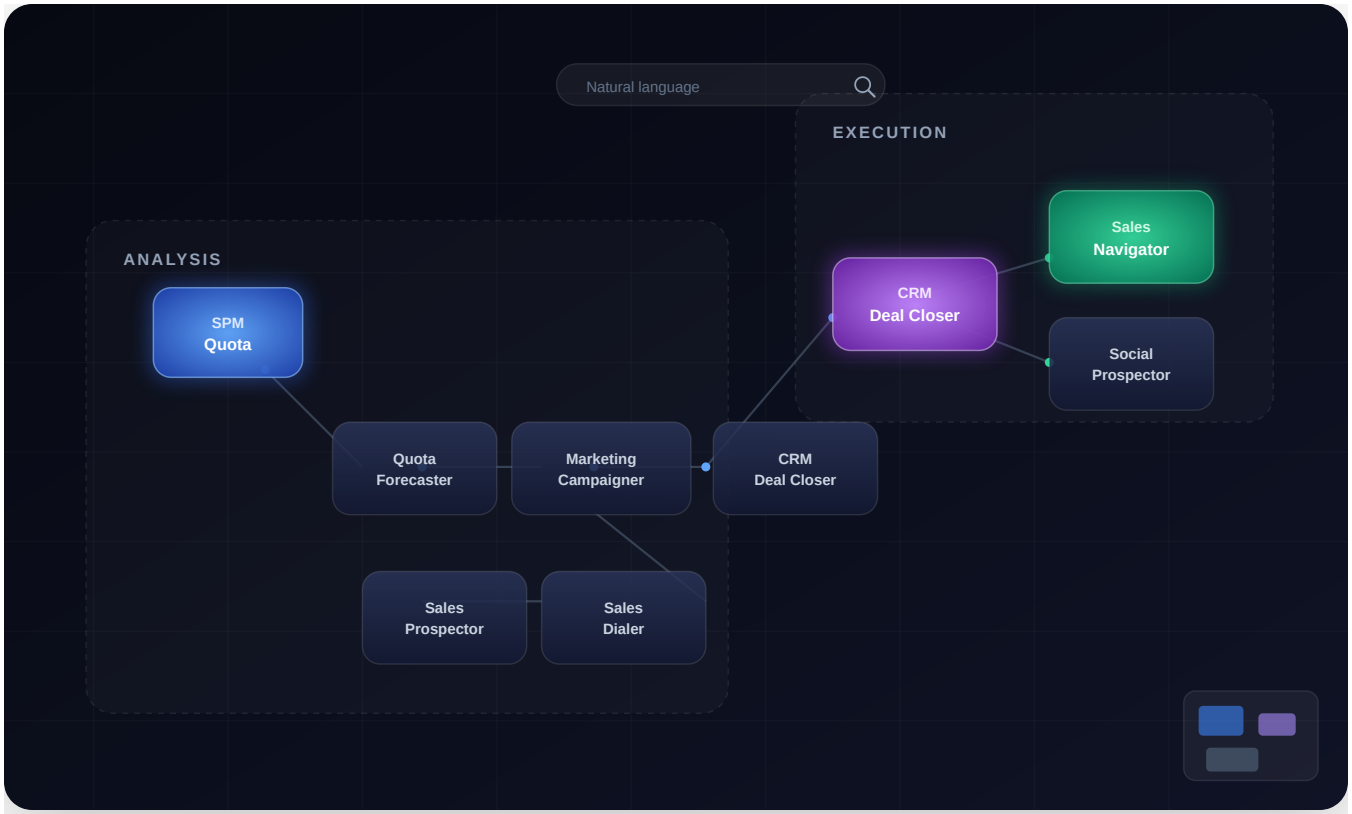
2. Agent Lanara Canvas (The creation & orchestration workspace)

This is where it gets *bold*.

Infinite canvas. Drag agents as rich cards/nodes. Connect them with smart flows. Group them into visual “Business Unit Zones” that act like containers (drop an agent in → it inherits RAG and permissions).

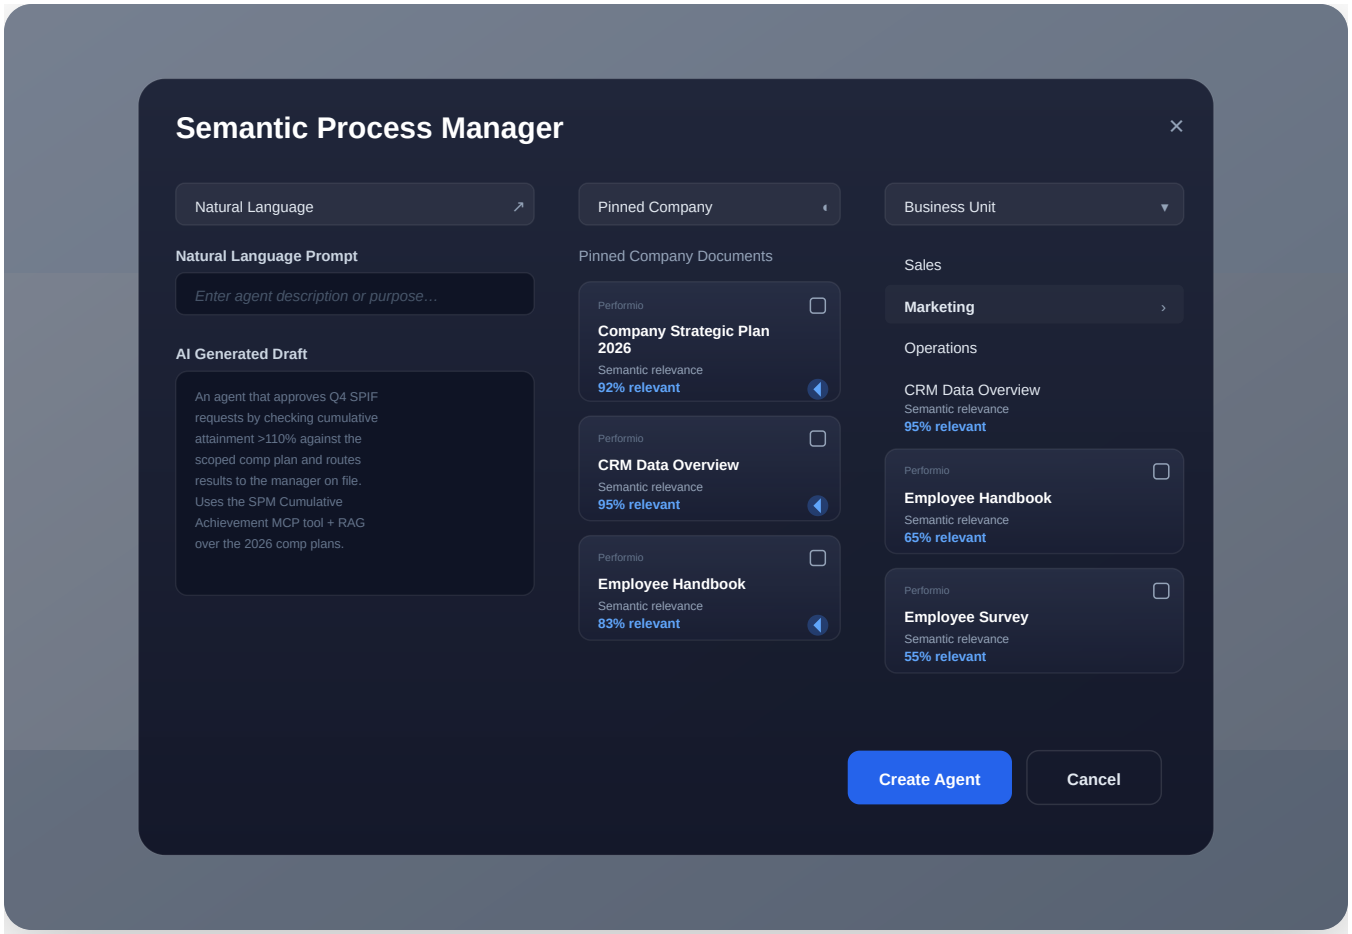
Hybrid mode: top command bar lets you type “Build me a Q4 SPIF approval agent that checks cumulative achievement >110% and routes to manager” → AI instantly places a drafted agent on the canvas with suggested tools and RAG connections. Then you refine by dragging blocks, editing prompts inline, or connecting to CRM data sources.

Live preview pane on the right shows what the agent would do right now.



3. Integrated RAG Knowledge Hub + Agent Creation Modal

Every Business Unit has its own scoped document vault (comp plans, playbooks, CRM exports, historical payouts).
Drag-and-drop or auto-sync. Semantic search bar at the top. When creating an agent, the RAG sources are visually pinned to the agent card so users see exactly what knowledge it's grounded in.



Technical + Product Implications (quick hits)

- Canvas powered by the LangGraph + MCP stack you already like (visual editor on top of your orchestration layer).
- Business Unit scoping = tenant-like isolation at the UI/DB level (easy for enterprise compliance).
- Agents are versioned, auditable, and can be “published” or “draft” per unit.
- Start with 8–10 pre-built SPM/CRM agents (quota forecasting, clawback detection, deal acceleration, SPIF optimizer, etc.) that users can fork instantly.

This UI isn’t just modern — it feels like the **natural evolution of Performio/CaptivateIQ** but agent-native. It will make sales leaders say “finally, something built for us” instead of “another generic AI tool.”

Want to go even bolder? We can add:

- Voice-first creation (“Hey Lanara, build me an agent…”)
- 2.5D spatial mode for VR/Apple Vision Pro users

- Agent “marketplace” inside each Business Unit

Tell me which screen or flow you want to dive deeper on first (or paste any existing wireframes/screenshots), and we’ll refine the designs + start mapping the exact component structure.

Let’s build something that actually feels 2026. 🚀
